

Atorus Research, works as a technology company in the pharmaceutical space with the many goal of championing open source tools specifically in R, python, and Julia for use in the pharma industry. The specific work that the interns would work on involves assisting in the validation and testing of R packages for use with clinical trial data. The ideal candidate has some R and statistical background, but they do not need to be an expert in either although they do need some R programming basics. The company is remote, however some of our employees reside here in the triangle (myself included) and we frequently meet for meetings and to work together. This would be a combination of a mostly remote opportunity with the ability to meet in person to talk about how the work is going and discuss progress together.
